

Gait Smart Lock

Sraavya Pradeep, Garni Gharibian, Chirag Singh

Design & Motivation Recap

Motivation: Contactless Door Unlocking. When a user is authenticated by their unique gait, a smart lock will unlock when the user approaches a door.

Process

Sampling

Sample user's walking data with the Arduino clipped to their belt

Authentication

Matching users with unique gait, and authenticating it to unlock/open door.

System Network

Calibrate IMU data for authentication and distance measurement from door component

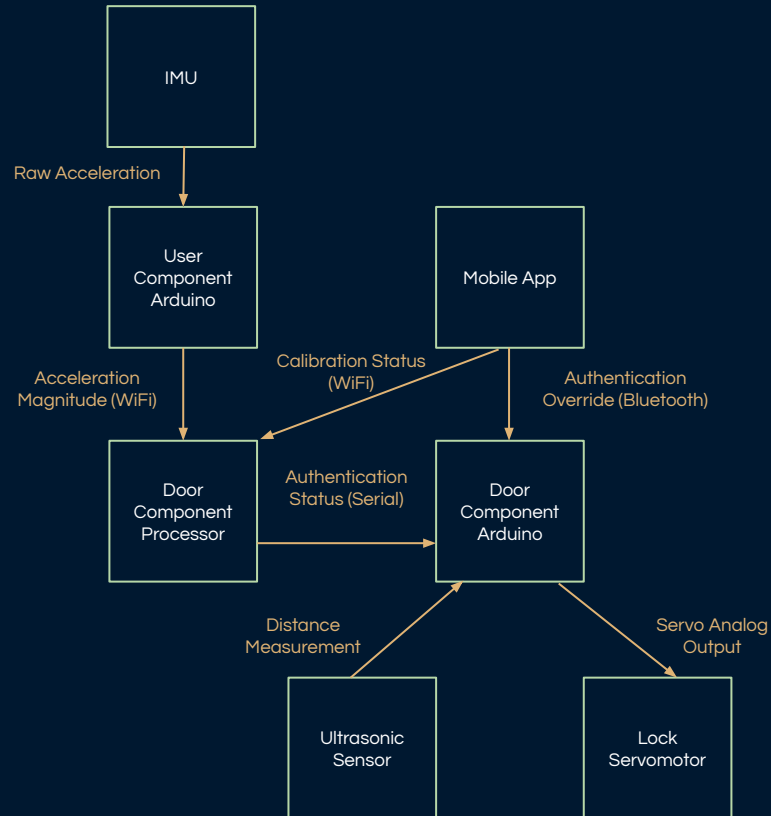

Processing Data

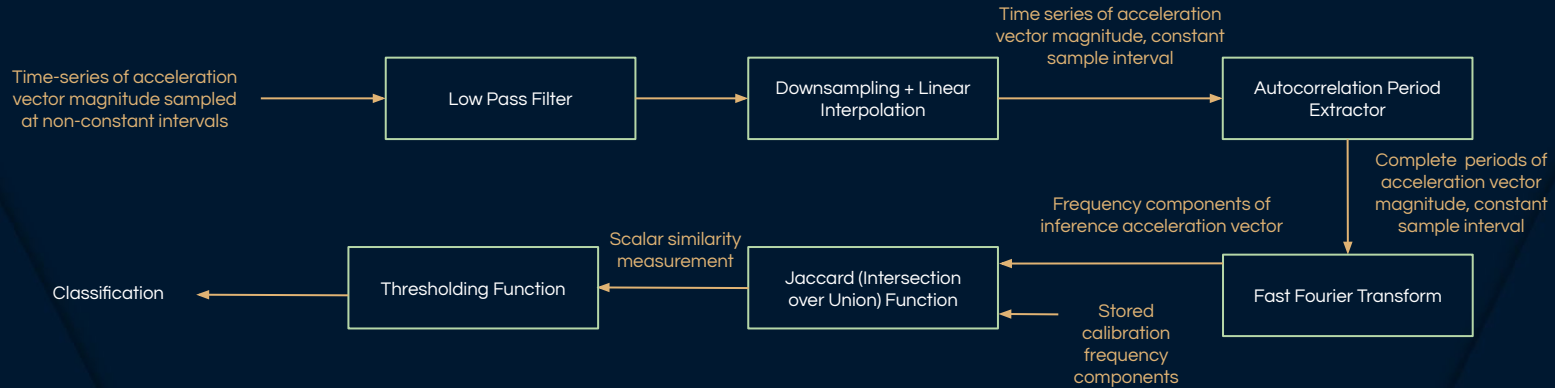

Running an inference process with data to create a decision tree & find classification

System Network Diagram

Inference Process Diagram

Final Results

Automatic Lock/Unlocking

The door's locking/unlocking mechanisms are highly reliable

Gait Detection

Accuracy: ~80%
F1 Score: ~60%

Bluetooth Override

We are able to override door lock manually

Individual Gait Calibration

Auto-Thresholding: Identify similarity value to generate high precision

The background is a dark navy blue with a network of thin, gold-colored lines forming various geometric shapes, including triangles and polygons, creating a modern, architectural feel.

DEMO!
